

A Dual Ledger for Monodromy Counterloops and Noisy Spectral Quotients

Bin Wang

July 2026

Abstract

The new monodromy counterloop bridge must not be conflated with an identified noisy spectral quotient. We therefore split the five-obligation ledger into two branches. The spectral vector remains $(0, 0, 0, 1, 1)$. The graded counterloop vector is $(1, 1, 0, 1, 1)$: its operator-derived head and coefficient bridge are exact, but its noisy variable-rank tail is open. Both complete counts are zero and Gates A–E remain false/open.

1 Two branches

The five entries are legal head, coefficient bridge, uniform quotient tail, analytic target tail, and certified target boundary constant.

branch	head	bridge	tail	target	boundary
noisy spectral quotient	0	0	0	1	1
graded monodromy counterloop	1	1	0	1	1

Proposition 1.1 (ledger consistency). *The spectral branch satisfies two of five obligations, the counterloop branch satisfies four of five, and neither is complete.*

Proof. RH-272 supplies the exact counterloop head and coefficient bridge. RH-274 and RH-275 show that actual cloud transport is not certified. RH-276 and RH-277 exclude the raw fixed-rank zero-noise quotient route in the natural stationary L^2 geometry, while RH-279 is only a conditional variable-rank replacement. The target-side entries were already certified in RH-262–RH-268. $\square$

2 Local versus zero-noise uniformity

RH-278 proves local positive-noise activation for an exact isolated shell. This is not the uniform small-noise tail required by either ledger. The rank may change between charts and the block depth may need to grow.

Remark 2.1. The counterloop is legal as a graded atomic superloop. Ordinary determinant quotient language still requires spectral identification; the two ledgers remain separate until that theorem exists.

3 Gate boundary

No complete Gate-A determinant identification has been constructed. Nothing here constructs a Hilbert–Polya operator, identifies Riemann zeros, proves a von Mangoldt trace identity, a completed-zeta divisor equality, or RH.
