

A Literal Contract for the Direct Additive-Twist Fixed-Atom Target

Liang Wang

July 2026

Abstract

The direct target is frozen as the q/N -normalized determinant-two core twist at the prescribed atom, uniformly in every deterministic scale and prefix. TPC-167 proves the exact phase Parseval identity, not this singleton theorem. The classification is `CONTRACT_L0_L1`; no L2 arithmetic progress or endpoint credit is claimed.

1 Frozen target

The selected route is `0161.direct_additive_twist_fixed_atom` [1]. The required signature is actual fixed- h_0 packet, named fixed atom, deterministic every prefix, deterministic every scale, fixed- X power at that atom, and actual active support. Throughout $h_0 = 2$ is only a source-backed data fact.

2 Exact result

Theorem 1. *Norm-axis separation theorem: the evaluation functional at one atom is unbounded on $L_2([0,1])$; therefore the TPC-167 L2 identity alone has no bounded implication to the requested point value.*

Proof. For the Dirichlet polynomials D_m , Parseval gives norm $\sqrt{m}$, while evaluation at zero gives m . The ratio $\sqrt{m}$ is unbounded. Thus no universal bounded evaluation map from phase L2 to a prescribed atom exists, and TPC-167 alone cannot instantiate the direct contract. $\square$

The smallest missing literal theorem is `DIRECT_ADDITIVE_TWIST_NAMED_ATOM_POWER_SAVING`.

3 Scoped stop and claim firewall

No new scoped stop is declared in this paper.

The result is L0/L1 only. Phase averages and Lebesgue-almost-every phase are not named atoms. Fixed $h_0 = 2$ is not decay. Archive addressing is not canonical physical representation, and empty-domain truth is not actual active support. The named-atom endpoint charge is zero, so the strict $1/400$ budget is unpaid. We claim no program-positive L2, prime-pair lower bound, or twin-prime theorem.

4 Reproducibility

The adjacent JSON payload records the full six-axis signature, source lock, typed result, exact scoped-stop cell, endpoint ledger, and claim firewall. The audit artifact contains eight true mutation-rejection assertions.
