

MVP9 after the Pointwise Fixed-Atom Frontier Audit

Liang Wang

July 2026

Abstract

MVP9 imports TPC-183–191 fail-closed. The structural first missing node and seven-root minimal blocker antichain are unchanged. Both pointwise O161 parents remain open; three method cells are STOP_SCOPED. Fixed-atom endpoint credit is zero and the strict 1/400 budget remains unpaid. The classification is MVP9_INTEGRATION; no L2 arithmetic progress or endpoint credit is claimed.

1 Frozen target

The selected route is POINTWISE_FRONTIER_REMAINS_OPEN [1]. The required signature is actual fixed- h_0 packet, named fixed atom, deterministic every prefix, deterministic every scale, fixed- X power at that atom, and actual active support. Throughout $h_0 = 2$ is only a source-backed data fact.

2 Exact result

Theorem 1. *MVP9 decision: Verdict=NOT_TESTABLE and FirstMissing=H1.source_backed_local_occurrence_edge_family. No scoped pointwise-method obstruction is promoted to global pointwise infeasibility.*

Proof. The MVP9 checker opens TPC-183–191 in paper order, verifies each canonical payload hash, expected verdict, selected route, six-axis signature, firewall, L2=false and zero endpoint credit. It reads the new scoped cells from TPC-187 and TPC-190 and the inherited selector cell from TPC-181. It also rechecks the unchanged TPC-182 global first missing node. These imports compute the stated route status without promoting a method stop to a theorem stop. $\square$

The smallest missing literal theorem is H1.source_backed_local_occurrence_edge_family.

3 Scoped stop and claim firewall

No new scoped stop is declared in this paper.

The result is L0/L1 only. Phase averages and Lebesgue-almost-every phase are not named atoms. Fixed $h_0 = 2$ is not decay. Archive addressing is not canonical physical representation, and empty-domain truth is not actual active support. The named-atom endpoint charge is zero, so the strict 1/400 budget is unpaid. We claim no program-positive L2, prime-pair lower bound, or twin-prime theorem.

4 Reproducibility

The adjacent JSON payload records the full six-axis signature, source lock, typed result, exact scoped-stop cell, endpoint ledger, and claim firewall. The audit artifact contains eight true mutation-rejection assertions.
